TITLE : SOUND FIELD REPRODUCING
DEVICE

ABSTRACT : PURPOSE: To attain listening in a sound field in matching with an input signal by obtaining a correlation coefficient of inputted 2-channel signals and controlling the sound field expanding quantity of a sound field expanding means in response to the correlation coefficient.

CONSTITUTION: The content of a sound source is discriminated from the inputted 2-channel signal by a correlation coefficient arithmetic means 1. As the method to discriminate the content of the sound source, the correlation coefficient of the 2-channel input signals is calculated. When the correlation coefficient is large, the delay time of delay devices 13, 14 is decreased and coefficients K1-K4 of multipliers 15-18 are decreased to bring the reproduced sound close to the direct sound from speakers 8, 9 thereby improving the articulation. On the other hand, when the correlation coefficient is small, the delay time of the delay devices 13, 14 is increased and the coefficients K1-K4 of multipliers 15-18 are kept to be prescribed values and the reproduced sound is the sum of the direct sound and a sound with a long delay time comprising L-R component. Thus, the listening with a broad presence is attained.
